

Transitional shelters and sewage, water and energy installations.

This concept aims to prepare shelters with fully working facilities to create a sustainable environment for people who lost their homes due to catastrophes.

The shelter design is made to handle repeated storms and flooding's.

The design is also made so it can be easily re used or rebuilt if another location is needed.

The design is also made for transportation as "flat pack" with the building material also used as package.

Picture below shows small village of double living shelters.

Picture below show a single living shelter with attached land ties:

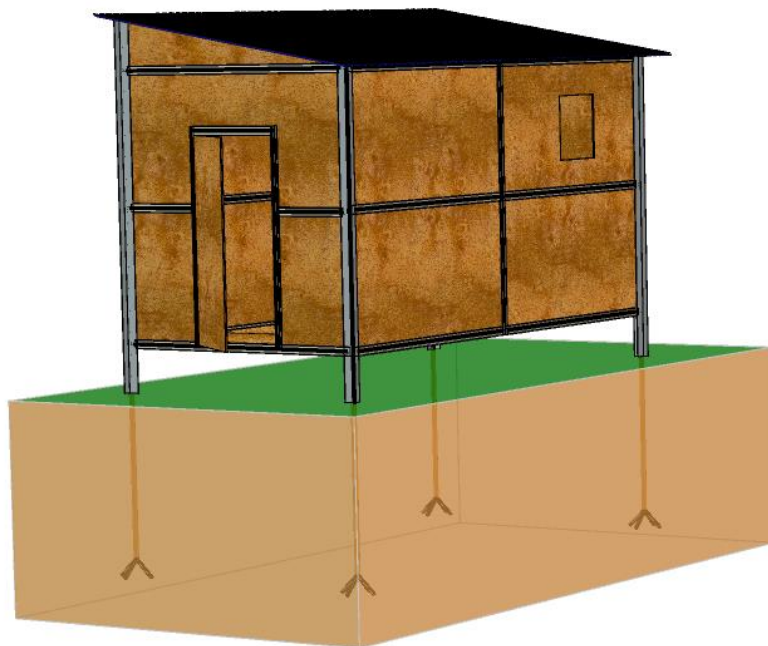

Photo of the corner profile that is the main framework in the concept.
